IPFIX Metering Process Location in SURFmap

Rick Hofstede, Abdelkader Lahmadi
Introduction

• Goal: Create a network monitoring tool that shows NetFlow data, which could be used by anybody
• Google Maps turned out to be a suitable platform
• Development started in 2008, published in 2009 (IM 2009), 5000 downloads (July 2013)
• Full-fledged NfSen plugin, with support for profiles, channels, etc.
Geolocation

- Data is aggregated into SURFmap zoom levels: country, region, city & host
  - Country, region & city information is provided by geolocation databases (e.g. MaxMind, IP2Location)
  - Host information is missing
- Having MP locations exported bridges the gap of missing host locations
